Assignment 14 - Assignment on Configure and secure SSH.

Must know about SSH

The objective of this assignment is to familiarize students with configuring and securing the SSH (Secure Shell) service on Red Hat Enterprise Linux (RHEL) 9.

Questions for this assignment

1. Discuss the importance of configuring SSH securely to protect against unauthorized access.
2. How to edit the SSH server configuration file to disable password authentication (**PasswordAuthentication no**)?
3. How to edit the SSH server configuration file (**/etc/ssh/sshd_config**) to customize SSH settings.
4. Provide instructions for generating SSH key pairs using **ssh-keygen**.

Solution by the Instructor:

1. Discuss the importance of configuring SSH securely to protect against unauthorized access.
   It provides encrypted communication between the client and the server, preventing eavesdropping and tampering.

2. How to edit the SSH server configuration file to disable password authentication (PasswordAuthentication no)?

- Set PasswordAuthentication no in /etc/ssh/sshd_config.
- Restart SSH service: sudo systemctl restart sshd.

3. How to edit the SSH server configuration file (/etc/ssh/sshd_config) to customize SSH settings.

- To edit the SSH server configuration file: sudo nano /etc/ssh/sshd_config
- Example configurations:
    - PermitRootLogin no: Disables root login via SSH.

- Port 2222: Changes the SSH port to 2222.

4. Provide instructions for generating SSH key pairs using ssh-keygen.
   To generate SSH key pair: ssh-keygen -t rsa
